Container Orchestration and Scheduling

Infrastructure

Kubernetes internal architecture by Brian Grant

Our experience with Kubernetes

Rancher 1.0:
Kubernetes distro

2016: Make
Kubernetes easy
to install

2017: Make
Kubernetes easy
to operate

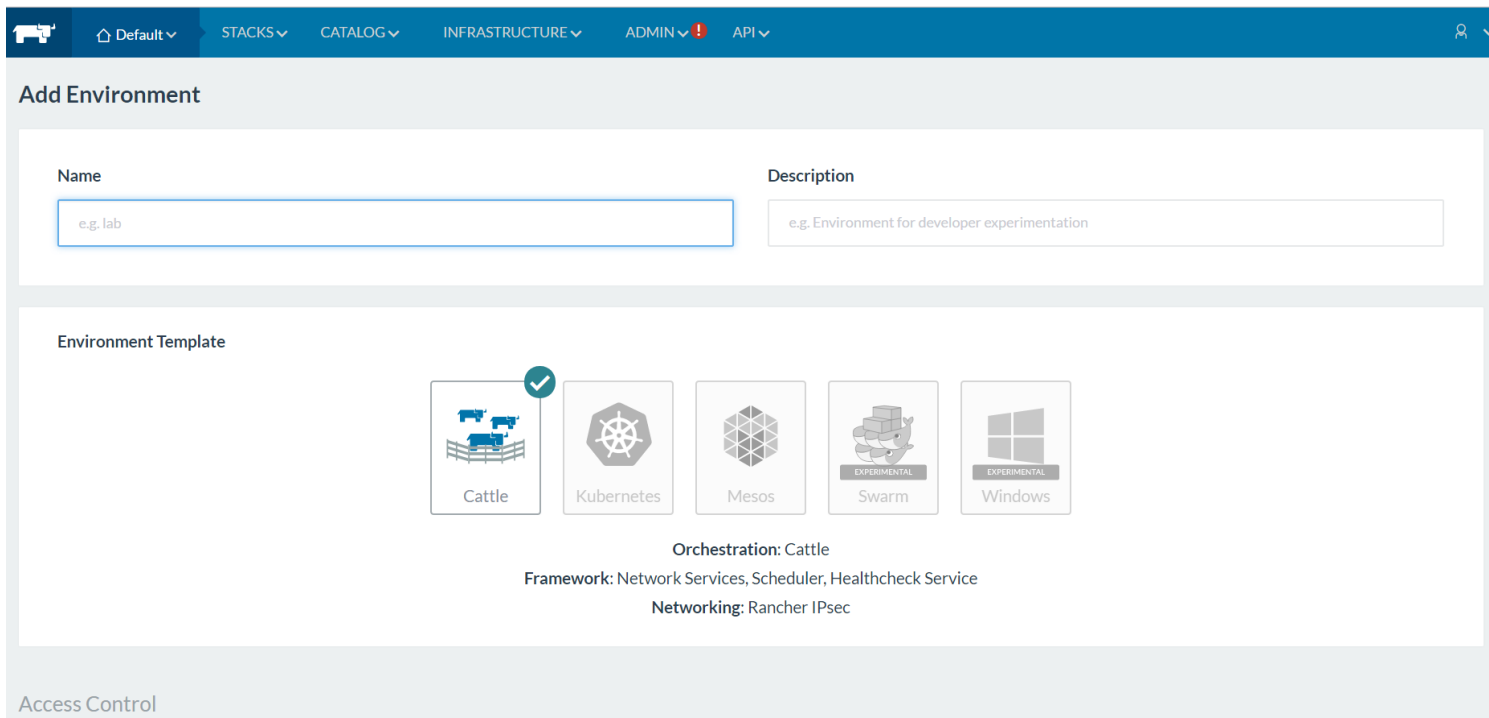

Manage all this?

App Catalog	Helm, ...
Orchestration	Compose, Kubernetes, Marathon, ...
Scheduling	Swarm, Kubernetes, Mesos, ...
Monitoring	cAdvisor, Prometheus, Datadog, ...
Access Control	LDAP, AD, GitHub, ...
Registry	Nexus, Artifactory, DTR...
Engine	Docker, runC, Rocket ...
Security	Notary, Vault, ...
Network	VXLAN, IPSEC, HAProxy, ...
Storage	Ceph, Gluster, Swift, ...
Distributed DB	Etd, Consul, MongoDB, ...

...or this?

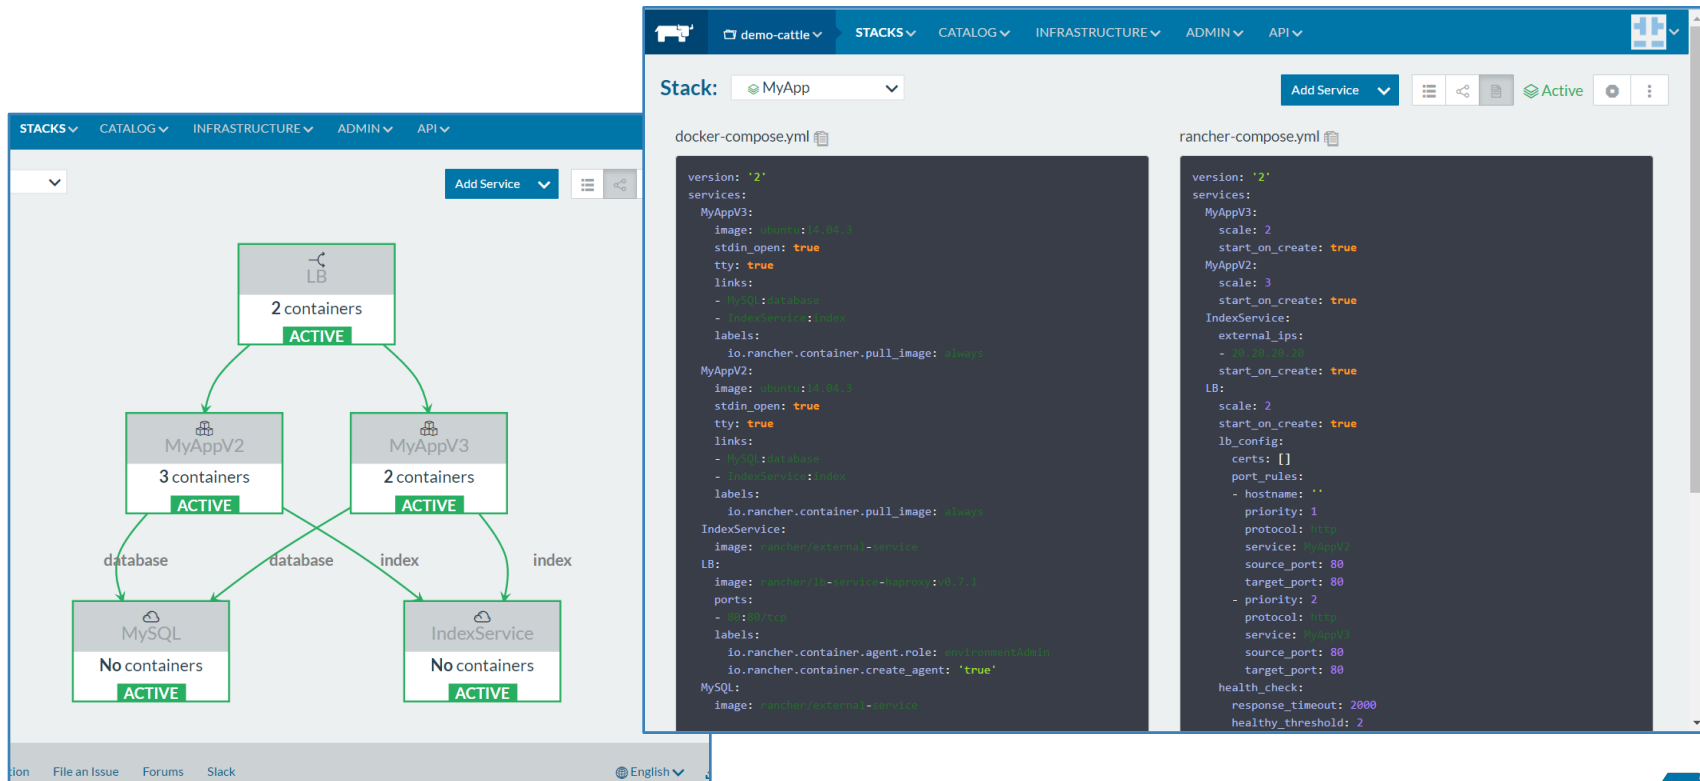

Support multiple orchestrators

The screenshot shows the 'Add Environment' page in the Rancher UI. The top navigation bar is blue with the Rancher logo and several menu items: 'Default', 'STACKS', 'CATALOG', 'INFRASTRUCTURE', 'ADMIN' (with a red exclamation mark), and 'API'. The main content area is light gray and contains the following sections:

- Add Environment**: A header section.
- Name**: A text input field with the placeholder 'e.g. lab'.
- Description**: A text input field with the placeholder 'e.g. Environment for developer experimentation'.
- Environment Template**: A section with five icons representing different orchestrators: Cattle (selected with a green checkmark), Kubernetes, Mesos, Swarm (marked 'EXPERIMENTAL'), and Windows (marked 'EXPERIMENTAL').
- Orchestration**: A label indicating 'Cattle' is selected.
- Framework**: A label indicating 'Network Services, Scheduler, Healthcheck Service'.
- Networking**: A label indicating 'Rancher IPsec'.
- Access Control**: A section at the bottom of the form.

Cattle orchestrator remains popular

Reason for Cattle's popularity: Simplicity

Cattle 2.0: even simpler

Service as basic unit
of operation

Future of Container Scheduling and Orchestration

The Operator pattern

“Orchestrator as Code”

Introducing the etcd Operator: Simplify etcd cluster configuration and management

November 03, 2016 • By Hongchao Deng

Tags: [Announcements](#)

Today, CoreOS introduced a new class of software in the Kubernetes community called an [Operator](#). An Operator builds upon the basic Kubernetes resource and controller concepts but includes application domain knowledge to take care of common tasks. They reduce the complexity of running distributed systems and help you focus on the desired configuration, not the details of manual deployment and lifecycle management.

[etcd](#) is a distributed key-value store. In fact, etcd is the primary datastore of Kubernetes; storing and replicating all Kubernetes cluster state. As a critical component of a Kubernetes cluster having a reliable automated approach to its configuration and management is imperative.

As a distributed consensus-based system, the cluster configuration of etcd can be complicated. Bootstrapping, maintaining quorum, reconfiguring cluster membership, creating backups, handling disaster recovery, and monitoring

Scheduling

1. Allocate resources
2. Usually a relatively simple operation that can be completed in a very short amount of time
3. Requires global knowledge

Orchestration

1. Performs configuration operations
2. A potentially long-running operation consisting of many small operations
3. Can usually be partitioned

Other features

Authentication

Authorization/RBAC/Governance

API gateway/server

Usage metering and chargeback

Plugins and drivers

Secret management

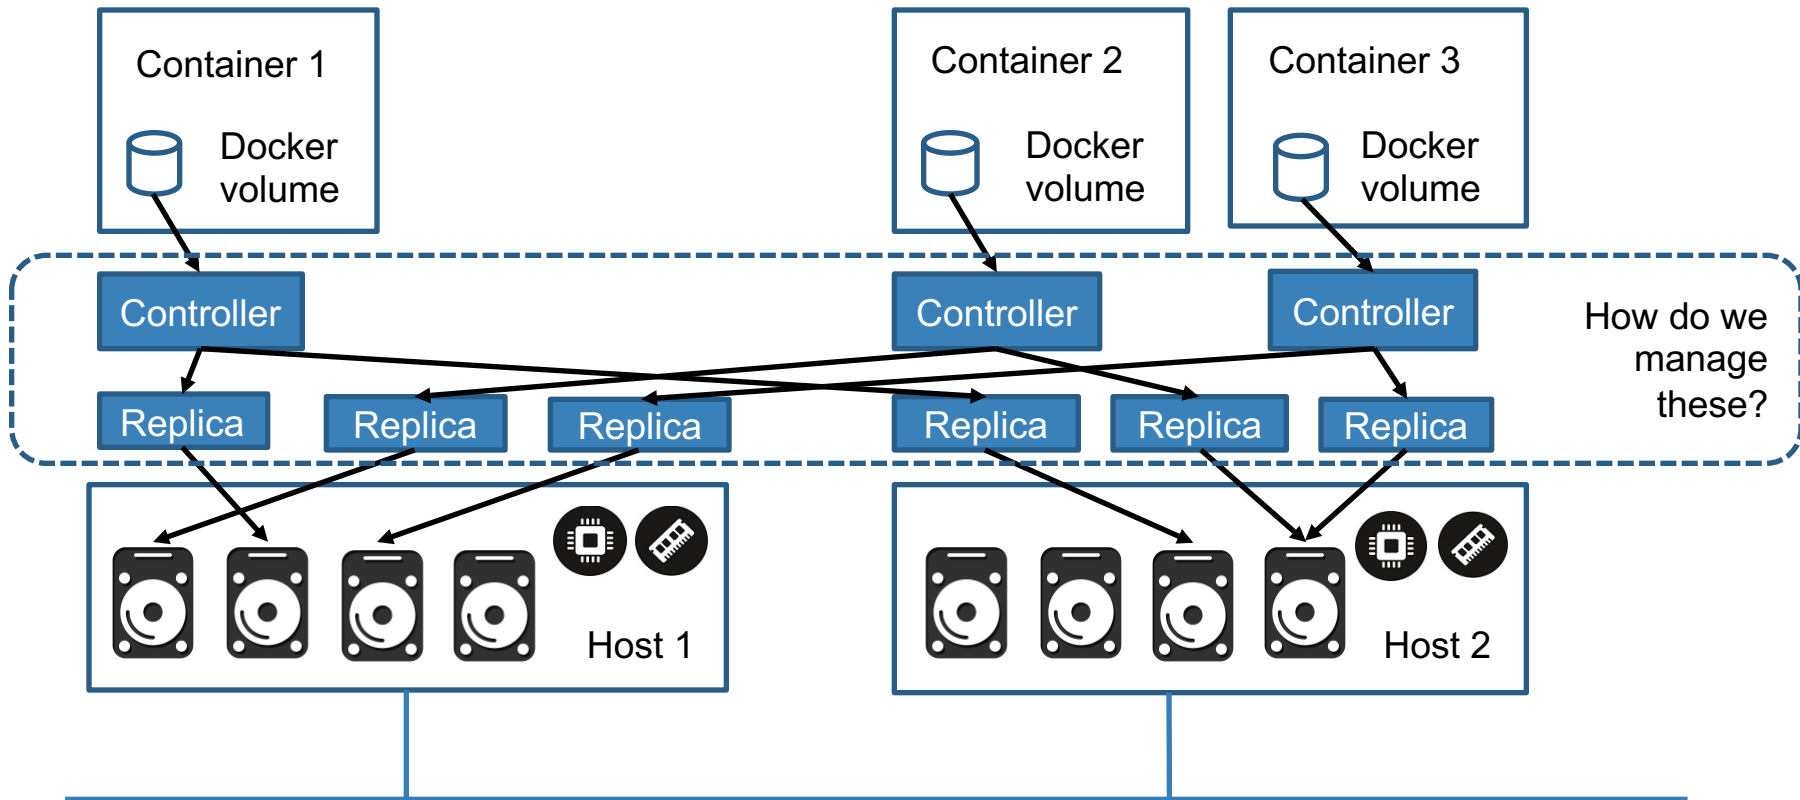

State management in Orchestration

Desired state: usually very small

An approximation of actual state: usually (unnecessarily) kept in the database

Job state: need not persist

Example: Longhorn storage orchestration

Longhorn storage orchestration

Orchestrator runs on every node without centralized master

Desired state: hardcoded, try to keep volumes healthy

An approximation of actual state: volume meta data

Job state: kept in memory, ephemeral

**If you have experience operating a
distributed system, you have
knowledge to write an orchestrator**

**There will be many more
orchestrators in the future**

Thank you
